# Ecology Food Chain Activity

- 1. The organisms in this diagram form a
- 2. What are the producers in the diagram?

  3. What are the secondary consumers in the diagram?
- 4. The diagram includes producers and consumers. What major group of organisms in **not** shown?
- 5. The removal of which organisms would result in the complete collapse of the ecosystem?
- 6. Pick 3 organisms from the diagram, and explain how they depend on one another.

7. Consider a food chain of corn  $\rightarrow$  mice  $\rightarrow$  fox.

One of the most important jobs that ecologists have to do is predicting the effects of disturbances on ecosystems. What will happen to the mice in this food chain if a farmer decides to eradicate (kill off) the fox population?

Following this, what will the effect be on the corn?

The next 10 items refer to the diagram below.

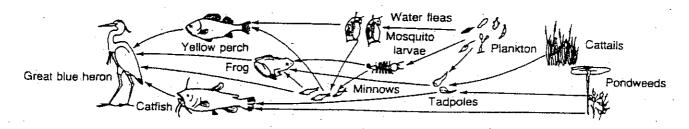

## True a False

- / . \_\_\_ In this food web raccoons are producers.
- 2 · \_\_\_ Bears feed on material which comes Andirectly from fruits and blossoms.
- 3. \_\_\_ If deer hunting were stopped for one season, the wolf population would tend to increase.

- 4. \_\_\_\_Deer are first-order consumers.
- 5. \_\_\_ Bears can be classified as first, second, and third-order consumers.

#### **ENERGY FLOW IN ECOSYSTEMS**

Study the diagram below, which illustrates a food web in a pond. Then complete the following table by listing the organisms that occupy each energy level. Some organisms will appear on more than one level because they are part of more than one food chain.

Producers	
First-order consumers	
Second-order consumers	
Third-order consumers	
Fourth-order consumers	

## CRITICAL THINKING: ENERGY PYRAMIDS

An energy pyramid represents the transfer of energy in a food chain. The pyramid illustrates the loss of energy sustained in each transfer. The diagram illustrates the energy pyramid for an ecosystem. Complete the listing of energy values and supply the correct name for the types of organisms found at each level.

Energy =		 	
Energy =		<del></del>	
Energy =			<del></del>
Energy = 10,000 calories

### Ecology Relationships between organisms

1. M	fatch each name of a relationship between organisms with its correct description:
	Predation A. The organisms are rivals for resources.  Mutualism B. One organism derives benefit, the other is unaffected.  Commensalism C. One organism derives benefit at the other's expense.  Parasitism D. One organism preys on another.  E. Both organisms gain some advantage from the interaction.
2. W	Then 2 organisms interact closely, this is called
(a)	assify each of the following relationships into one of the 5 types described in Question 1:  Clown fish are not affected by the stinging cells of sea anemones. They live very close to the anemones, darting in among the tentacles when danger threatens.  Cattle have complex stomachs which support populations of protists and bacteria that can synthesize a substance cattle cannot produce. The subtance (called an <i>enzyme</i> ) helps the cattle digest plant material.
(c)	Foxes feed on mice and rabbits; in doing so they remove the less healthy animals from the mice and rabbit populations and keep their numbers in check.
(d)	Ticks live by sucking the bl∞d of mammals.
(e)	Viruses infect and live within cells of different organisms; in this way they can produce disease.

## **Ecology Review Sheet**

Match the letter of the term or phrase on the right with the phrases on the left (some of the lettered terms on the right will not be used).

1. Green plants that undergo photosynthesis	A. food web
2,Feeds directly on the producer	B. herbivore
3. Feeds on a primary consumer	C. primary consumer
4. Living things	D. abiotic
5. Water, light, temperature, sand, rocks;	E. ecosystem
physical factors that affect living things	F. parasitism
6. When an organism feeds on and lives in a host, causing harm to the host	G. producer
7. Symbiotic relationship where 2 organisms	H. scavengers
benefit one another	I. commensalism
8. Symbiotic relationship where one or more organisms benefit, and others are not harmed	J. secondary consumer
9. A group of interconnecting food chains	K. sun
10. Source of energy that producers convert	L carnivore
to chemical energy in photosynthesis	M. biotic
11. Water lilies → snails → ducks	N. mutualism
12. Interaction of living things with their nonliving environment. Ex. pond, ocean, forest	O. food chain
13. A group of organisms living together in an area	P. decomposers
	Q. omnivore
14. Decays dead organisms and returns minerals to the ecosystem	R. pyramid of energy
15. Consumers that feed only on plants.	S. community
Ex. rabbit	T. organisms
16. Consumers that eat plants and meat. Ex. humans

THE NITROGEN CYCLE

Match the lettered items in the illustration of the nitrogen cycle with the items below.

Circles represent organisms; squares represent substances; and letters represent processes

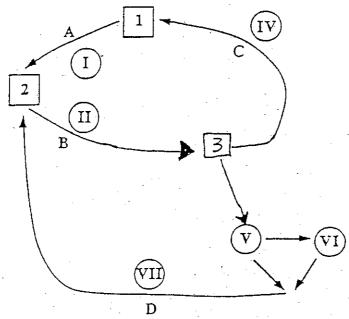

NOTE: Square #1 represents nitrogen gas  $(N_2)$ 

B. 2

#### Succession Worksheet

Communities can appear and disappear during a succession of changes in an ecosystem. Study the diagram below which illustrates what happened to the land on an abandoned farm in the southeastern United States over a period of 100 years.

<b>.</b>	an area are caneu	· ·
These include (many, few)	different species: The kinds of species in	Stage A produce (many, few
seeds, and gr	row (slowly, quickly)	
During the second Stage B, differen	nt species begin to grow, such as	·
There is (more, less)-	competition between species during the second	stage than during the first.
The first 25 years after the farm was	s abandoned, the soil continued to change, to become	me (more, less)
fertile, and able to	support (more, fewer) species. A	fter 25 years, the species in
the area became (more, less)	stable, and a (pine, hardwood/deciduou	<i>x</i> )
	forest developed. Gradually, the	
pine, hardwood/deciduous	forest crowded out the	other one. When compared
with stage A, stage E has (more, fev	wer) species. Stage E also has (n	nore, fewer)
individuals of a sp	ecies than Stage A. Stage E is called	
and is a (stable, changing)	community. The type of succession :	that took place aft
is known as (primary, secondary)	succession.	the farm was,
		•

latest (	the stages in the primary succession in a natural rolest comme (6):		
<u></u>	Pine Trees begin to grow in direct sunlight.	•	
	Ferns, grasses, and shrubs appear.		<del>-</del>
	Primitive soil forms as decomposers breakdown dead pion	eer organisms.	
	Mosses anchor in the soil.		
	Beeches and maples become the dominant species.		
	Organisms such as lichens begin to grow on bare rock.		
(a limi	limiting factors keep grasses from being present in the climax iting factor is a resource that, if present in short supply, will list sms in a community)	community? mit the growth or repro	duction of those
5. What l	limiting factors keep oak trees from being present in the pione	eer community?

# Growth of Populations

Population growth can be shown with a J-shaped curve or an S-shaped curve. Answer each of the following questions by identifying the curve described as J-shaped or S-shaped.

1.	Which curve shows that a line	vprd bi	o-snapen.	-	
	Which curve she ws that a population has stopped increasing in size?		4		
2.	Which curve shows that the size of a population will increase indefinite	ely?		·	
3.	Which curve she ws a populations growth under ideal conditions?				
	Which curve shows the growth of a rabbit population living in a forest?	)		<u> </u>	

5. Which curve shows a populations biotic potential?

Suppose that the table below represents information about the growth of a particular bee population. Use the information in the table to answer the questions that follow.

Population Age in weeks	Number of Bees	Increase in Number of bees
	1000	
4	4000	3000
7	24 000	20 000
10	46 000	22 000
16	70 000	24 000
19	80 000	10 000
<del></del>	80 000	0

5.	During which two 3-week periods was the increase in the bee population the greatest?	
7.	At what stage of the bee population was the growth the slowest?	
3.	What kind of curve (J or S) would the growth shown in this table make?
